

HiveWatch + AVIGILON™

**Harness the power of the Avigilon Alta Access and Video
with the HiveWatch® GSOC Operating System**

Together, **HiveWatch** and **Avigilon** allow your workforce to be more efficient, proactive, and effective at keeping people and assets safe.

The **HiveWatch® GSOC Operating System** is fully integrated with Avigilon Alta Video and Avigilon Alta Access, allowing security leaders to fully realize the benefits of HiveWatch with the capabilities of the Avigilon Alta suite.

Within the HiveWatch® platform, users can now stream live and alarm-related footage from Avigilon cameras, along with access-related events in a single, easy-to-use platform alongside other existing data streams. Leveraging Avigilon's streaming APIs means that HiveWatch customers do not need additional hardware, further enhancing scalability.

How it Works:

- Stream live and alarm-related footage from Avigilon Alta cameras (and other video surveillance devices), along with access-related events in a single, easy-to-use platform
- Centralize the management of multiple video and access control feeds to enable GSOC operators the ability to quickly and efficiently respond to events
- Collect incoming data to provide metrics on the efficacy of security programs, field resource management, time to respond/resolve incidents, and much more

Avigilon customers can now leverage HiveWatch to:

- Reduce false alarms
- Provide performance metrics and analytics
- Centralize the storage of security resources (SOPs, device data, floor plans, etc.)
- Streamline incident management and response
- Optimize communication between operators and field resources (like guards)
- Manage guard patrols and field-reported incidents
- Dispatch localized emergency response (e911)
