# Avigilon to VehicleManager Enterprise Integration

## Enhancing safety through a link between law enforcement and local businesses

The foundation of a community's public safety efforts are grounded by transparency, trust and in concert with their local law enforcement agencies. Public-Private Partnerships help to bridge this gap. Through innovative and collaborative license plate sharing programs, where businesses can opt in to share their license plate recognition (LPR) camera data with law enforcement, businesses are doing their part to help agencies identify critical data to ensure a safer community.

The Avigilon to VehicleManager integration allows businesses to share their license plate reads collected by Avigilon Unity Video with a law enforcement agency's VehicleManager account. Through this collaborative license plate sharing program, the business can aid law enforcement agencies to detect and respond to Be-On-the-Lookout (BOLOs) for vehicles without the business needing to take any action, ensuring a safer outcome for the community.

### Plate sharing

Every license plate read detected by Unity Video is sent to the designated agency's VehicleManager account, with the following data shared by Unity Video for each license plate detected: license plate, image of license plate, image of vehicle, GPS location associated with camera, and data and time of the plate read.

### Data ownership

License plate data shared with and stored in VehicleManager Enterprise are wholly owned by the customer. Retention policies for license plate data are set by the Site Administrator in Unity Video and VehicleManager Enterprise, respectively. Data shared by VehicleManager Enterprise with VehicleManager follows the data retention policy set by the Site Administrator in VehicleManager Enterprise.

### Data security

Data transmission uses industry standard encryption. Data stored in Unity Video and VehicleManager Enterprise can only be accessed by authorized personnel. Avigilon and Vigilant Technical Support personnel cannot access customer data unless authorized. Access authorizations can be revoked at any time by Site Administrators through user management interfaces in Unity Video and VehicleManager Enterprise.
