General IP Camera Web Interface User Guide

You can use the camera web interface to check the camera's status and image quality, edit camera settings, manage features and upgrade firmware.

Make sure you have completed the installation procedure and added the camera to the network before you try to access the web interface.

The supported features depend on the specific camera model. The features outlined in this guide apply to the following camera models:

H6A-xxx	H6X-xxx	H6A-xxx-IR	H6X-xxx-IR
H6SL-xx	H6M-Dx	H5A-CR1-IR-xx	H5A-CR2-IR-xx
H5A-xx-IR	H6M-Dx-IR	H5SL-xx	H5SL-xx-IR
H5A-xx	H5EX-xx-CO1	H5EX-xx-BO1	H4SL-xx (-IR)
H5M-DO	H4M-D	H4A-ETD-KIT	H4A-GB (-B)
H4A-THC-BO	H4F-DO	H4A-xx-IR (-B)	H4A-G-xx-IR (-B)
H4A-xx (-B)	H3A-BO-IR	H3A-xx	

Web Interface System Requirements

The following browsers are recommended when accessing the web interface from any Windows, Mac, or mobile device:

- Mozilla Firefox version 96.0.2 (64-bit) or later
- Google Chrome™ version 97.0.4692.71 (64-bit, official build) or later
- Microsoft Edge version 97.0.1072.76 (64-bit, official build) or later

NOTE

The web interface may work with older or unsupported browsers, but this has not been tested.

Accessing the Camera Web Interface

You can access the camera web interface using the camera's IP address. The IP address is assigned automatically once the camera is discovered on the network using either CCT, Unity Video or ACC. Make sure the computer you are using to access the web interface is connected to the same network as the camera you are trying to access.

The IP address is assigned automatically once the camera is discovered on the network using either CCT, Unity Video or ACC. You can find the IP address in the following places:

- Avigilon Unity Video or ACC – navigate to Site Setup and select the camera. Click Network Settings and chose how to obtain an IP address.
- Camera Configuration Tool – select the camera and navigate to the Network tab.

Follow these steps to access the web interface:

1. Find the camera's IP address.
2. Copy and paste the IP address into a web browser: http://*<device IP address>*/. Example: http://192.168.1.40/

   NOTE

   The web browser must be configured to accept cookies or the camera web interface will not function correctly.
3. Enter the username and password to log into the camera.
   If the camera is in the factory default state and was manufactured after January 1, 2020, you will be asked to create a user with administrator privileges before the device will be operational. For more information, see *Creating the Initial User and Logging In* below.

Creating the Initial User and Logging In

New cameras do not have a default username and password and will be in a factory default state.

IMPORTANT

You must create a user with *administrator* privileges before the camera is operational.

When logging into the camera for the first time, you will be redirected to the Add User page to create an administrator user:

1. Enter a new **User Name** or keep the default `administrator` name.
2. Enter a new **Password** for the user. We recommend using a complex and unique password. Avoid using an empty password as they are not supported across all platforms and devices.
3. Confirm the new password.
4. For the first user, *Administrator* must be selected in the **Security Group** drop-down menu.
5. Click **Apply**. After creating the user, you will be asked to login.

Logging In

Cameras manufactured before January 1, 2020, have a default username and password you can use to log in.

You will automatically be prompted to enter your username and password to access the camera.

- If the camera is in the factory default state and was manufactured after January 1, 2020, you will be asked to create a user with administrator privileges before the camera will be operational. Use these credentials when logging in.
- The default username for most cameras is `administrator` with no password.

TIP

It is recommended that you add a password after your first login. For more information, see *Editing Users and Passwords* on page xlv.

Live View

After you log in, the first page you see is the Live View. The Live View contains an image panel that displays the live video stream.

Use the menu links in the top-left corner to navigate through the web interface. Click **Live View** any time to return to this page.

> **TIP**
> Features and options are disabled if they are not supported by the camera.

Saving a Still Image

If you see the **Save Still to SD Card** button from the Live View page, the camera supports the ability to take snapshots of live video from the web interface.

To use this feature, the following settings are required for the camera:

- There is an SD card inserted in the camera. For more information, see the camera's installation guide. Saving an image to the SD card is not supported if you are using FIPS Level 3 encryption with a CryptR micro card inserted in the SD slot.
- The camera's onboard storage settings are enabled on the Storage page. For more information, see *Storage* on page xxxix.
- The camera's video format must be set to MJPEG in the Compression and Image Rate page. For more information, see *Compression and Image Rate* on page xxvi.

Once all the requirements have been met, you can click **Save Still to SD Card** and the image that is displayed in the Live View page is automatically saved to the SD card.

To download the snapshot, see *Downloading Recorded Video from the Web Interface* on page xli.

Setup

NOTE

Certain options are not displayed if they are not supported by the camera model you are using or if you do not have the required user permissions.

The factory default settings allow you to use the camera or encoder immediately after installation. If you have special requirements, you can customize the settings through the web interface. In the top-left menu area, click **Setup** to display all the available setup pages.

A **Restore Defaults** button is available on each setup page to restore the factory default settings.

Be aware that some settings are only available through the camera's web interface and cannot be changed in the network video management software.

For information specific to H4 Edge Solution (ES) cameras, see *ACC™ ES Camera* on page liii.

For settings that are specific to the H4 Thermal Elevated Temperature Detection cameras, see the H4 Thermal Elevated Temperature Detection Camera User Guide.

General

When you select Setup, the first page you see is the General page. The General page allows you to set the camera's identity.

TIP

Features and options are disabled if they are not supported by the camera.

NOTE

If a camera with video analytics or unusual motion detection is physically moved or adjusted, or if the focus or zoom level is changed, reset the learning progress to provide accurate results. If the camera's image rate and compression or display settings are updated, the learning progress may reset automatically.

1. In the **Name** field, give the camera a meaningful name.
2. In the **Location** field, describe the camera's location.
3. Select the **Disable device status LEDs** check box to disable the LED indicators located on the camera.
4. Select the **Lens Distortion Correction** check box to enable an algorithm-based automatic correction of lens distortion. The camera will reboot when applying this setting.
5. From the **Mode** drop-down list, select the mode that the camera will operate in. The camera will reboot after you change the camera mode.
   This option is only displayed for higher bandwidth usage cameras.
   - **Full Feature** – This is the standard operating mode. Offers the full functionality of the camera.
   - **High Framerate** – This mode will use the maximum image rate possible but will disable self-learning video analytics, Unusual Motion Detection (UMD), and tamper detection and WDR on ES cameras.

Models	Features Impacted by High Framerate
4K (8 MP) H4 HD Analytic Cameras: 8.0-H4A-x	◦ Increased maximum frame rate ◦ Self-learning video analytics and tamper disabled ◦ Unusual Motion Detection (UMD) disabled ◦ Lower resolution tertiary video stream ◦ Secondary video stream disabled
H4 HD ES Analytic Cameras: xx-H4A-xG-x	◦ Increased maximum frame rate ◦ WDR disabled

   - **No Video Analytics** – This mode will disable video analytics. This option is for deployments where camera-based video analytics would interfere with other analytics integrations.

6. Select any of the Overlay Setting check boxes to display and stamp that information on the camera's video stream. The options are:
    - **Display Date**
      Selecting the Display Date check box also enables the **Date Format** drop-down list. From the list, choose the date format which will be used to display the date.
    - **Display Time**
    - **Display GMT Offset**
    - **Display Name**
    - **Display Location**
7. Use the **Font Size** field to make the font larger or smaller. The default font size is 24. You can make the font as small as 12 or as large as 120.
8. In the Time Settings area, select how the camera keeps time.
    - If you prefer to manually set the camera's date and time, enter the time zone on this page.
    - Select the **Automatically adjust clock for Daylight Savings Time** check box, if required.
    - If you prefer to auto-synchronize the camera's date and time with an NTP server, the NTP server must be configured. Click on the (Configure NTP Server) link at the bottom of the page to be redirected to the Network page.
      For more information on configuring the NTP server, see Step 7 under *Network* below.

    CAUTION
    The time setting must always be current or the ACC software will reject the video stream from the camera. To ensure that the time is always current you should do one of the following:

    - Set up NTP on the DHCP server used by the ACC software.
    - Use a valid public NTP server.
    - Manually set the correct time in the Time Settings fields.
9. Click **Apply** to save your settings.

Network

On the Network page, you can change how the camera connects to the server network and choose how the camera keeps time.

1. At the top of the page, select how the camera obtains an IP address:
    - **Obtain an IP address automatically**: select this option to connect to the network through an automatically assigned IP address.
      The IP address is obtained from a DHCP server. If it cannot obtain an address, the IP address will default to addresses in the 169.254.x.x range.
    - **Use the following IP address**: select this option to manually assign a static IP address.
        - **IP Address**: Enter the IP Address you want to use.
        - **Subnet Mask**: Enter the Subnet Mask you want to use.
        - **Default Gateway**: Enter the Default Gateway you want to use.

2. If the camera supports IPv6, select the **Enable IPv6** check box to configure the following settings.

   > **NOTE**
   > Enabling IPv6 does not disable IPv4 settings.

   a. Ensure the **Accept Router Advertisements** check box is checked if using Stateless Address Auto-Configuration.
   b. From the **DHCPv6 State** drop-down list, select one of the following:
      - **Auto**: DHCPv6 state is determined by router advertisements (RA).

        > **NOTE**
        > The Accept Router Advertisements setting must be enabled for this setting to perform as expected.

      - **Stateful**: the camera receives IP address, DNS and NTP information from the DHCPv6 server.
      - **Stateless**: the camera only receives DNS and NTP information from the DHCPv6 server. It does not accept an IP address from the DHCPv6 server.
      - **Off**: the camera does not communicate with the DHCPv6 server.
   c. In the **Static IPv6 Addresses** field, enter the preferred IPv6 address.
      - Click **+** for additional addresses.
      - Click **—** to remove an address.

      To change the prefix length, enter the preferred IPv6 address using Classless Inter-Domain Routing (CIDR) notation. For example, `2001:db8::1/32` would indicate the address prefix is 32-bits long. By default, the prefix length is set to `/64`.

      > **NOTE**
      > The configured prefix length may not display correctly in the web interface, but the prefix used by the camera will be the configured length.

   d. In the **Default Gateway** field, enter the Default Gateway you prefer to use. You can only assign a Default Gateway if RA is disabled.

   The IPv6 addresses that can be used to access the camera are listed under the **Current IPv6 Addresses** area.
3. Uncheck the **Enable WS Discovery Protocol** checkbox to turn off the WS Discovery protocol. This option is enabled by default.
   WS Discovery is used to scan and find cameras on the same network. This is required when using the Camera Configuration Tool and certain Video Management Systems. You can turn off WS Discovery after installation as a security precaution.
4. If you need to customize the hostname, enter it in the **Hostname** field.
5. In the DNS Lookup area, select how the camera will obtain a Domain Name System (DNS) server address.

- **Obtain DNS server address automatically**: select this option to automatically find a DNS server.
- **Use the following DNS server addresses**: select this option to manually set DNS server addresses. You can set up to three addresses:
  - **Preferred DNS server**: assign the address of the preferred DNS server in this field.
  - **Alternate DNS server 1**: (optional) assign the address of an alternate DNS server to this field. In the case that the preferred server is not available, the camera will attempt to connect to this server.
  - **Alternate DNS server 2**: (optional) assign the address of another alternate DNS server to this field. In the case that both the preferred server and the first alternate server are unavailable, the camera will attempt to connect to this server.

6. In the Control Ports area, you can specify which control ports are used to access the camera. You can enter any port number between 1 and 65534. The default port numbers are:
   - **HTTP Port**: 80
     If you want to limit camera access to secure connections only, clear the **Enable HTTP connections** check box. HTTP Port access is enabled by default.
   - **HTTPS Port**: 443
   - **RTSP Port**: 554
   - **RTSP Replay Port**: 555
7. In the NTP Server area, indicate if you want the camera to use an NTP server to keep time.
   a. Select the NTP source to use for keeping time:
      - **Always use Avigilon Control Center NTP Server**. Select this option if you want the camera to keep time through the Avigilon Control Center™ software only.
      - **Always use external NTP server**. Select this option if you want to use an external NTP server only. Then configure the NTP server to use.
      - **Use Avigilon Control Center Server with a failover external NTP**. By default, Avigilon cameras keep time through the Avigilon Control Center software and will use an external NTP Server when not connected to an ACC server, if one is configured.
   b. If you are using an external NTP server, select how the server is configured:
      - **DHCP**.
      - **Manual**. Select this option and then enter the server address in the **NTP Server** field.
8. In the MTU area, set the Maximum Transmission Unit (MTU) size in bytes. Enter a number between the available range displayed on the right. You may want to lower the MTU size if your network connection is slow.
9. In the Ethernet Setting area, set the **Speed & Duplex** for your network connection. The Auto-negotiation (default) setting is the preferred setting for most cameras, and will negotiate the optimal speed and duplex setting for your network connection. If necessary, you can manually select the speed and duplex setting for your connection.
10. In the Security area, set the **Minimum TLS version** that the camera should use for encrypting the communication between camera and server and block older TLS versions that should not be used.

- **TLS 1.3** is recommended for increased security.

  > **NOTE**
  > Please verify that this is supported by your VMS before enabling this option.

- **TLS 1.2** can be selected if it is required for backwards compatibility.

  > **NOTE**
  > Some cameras may also have the **TLS 1.1** options, which can be selected if it is required for backwards compatibility.

11. Click **Apply** to save your settings.

Configuring 802.1x Port-Based Authentication

If your network switch requires 802.1x port-based authentication, you can set up the appropriate camera credentials so that the video stream is not blocked by the switch.

1. In the left-menu pane, select **Network > 802.1x**.
2. On the Configure 802.1x Profiles page, select the preferred authentication method. You can configure multiple profiles. Be aware that you can only enable one profile at a time.
   From the **EAP Method** drop-down list, select one of the following and complete the related fields:
   - Select **PEAP** for username and password authentication.
     - **Configuration Name:** give the profile a name.
     - **EAP Identity:** enter the username that will be used to authenticate the camera.
     - **Password:** enter the password that will be used to authenticate the camera.
     - **Authenticate Server**: check this box if you need to add a certificate.
   - Select **EAP-TLS** for certificate authentication.
     - **Configuration Name:** give the profile a name.
     - **EAP Identity:** enter the username that will be used to authenticate the camera.
     - **TLS Client Certificates:** select the PEM-encoded certificate file to authenticate the camera.
     - **Private Key:** select the PEM-encoded private key file to authenticate the camera.
     - **Private Key Password:** if the private key has a password, enter the password here.
     - Click **Upload Files** and the TLS client certificate and private key are uploaded to the camera. The uploaded files are used to generate a unique certificate to authenticate the camera. The unique certificate is displayed in the Uploaded Certificate field.
3. Click **Save Config** to save the authentication profile.
   If this is the first profile added to the camera, it is automatically enabled.
   Saved configurations are listed under **Saved 802.1x Configurations**.

Switching 802.1x Authentication Profiles

To use a different authentication profile, select the saved configuration then click **Enable**.

Deleting an 802.1x Authentication Profile

To delete one of the authentication profiles, select the saved configuration then click **Remove**.

Configuring SNMP

You can use the Simple Network Management Protocol (SNMP) to help manage cameras that are connected to the network. When SNMP is enabled, camera status information can be sent to an SNMP management station.

On the SNMP page, you can configure the camera's SNMP settings and choose the status information that is sent to the management station page. For more details on the status information or traps that will be sent, see the camera's Management Information Base (MIB) file on the Avigilon website: http://avigilon.com/support-and-downloads.

1. In the left-menu pane, select **Network > SNMP**.
2. On the SNMP page, select the **Enable SNMP** check box.
3. From the **Version** drop-down list, select the preferred SNMP version. Be aware that both versions can be configured, but only one can be enabled at a time:
   - **SNMP v2c**: Using SNMP v2c, you can make a request to the camera for status information through an SNMP Get request and receive trap notifications from the camera.

     In the **SNMP v2c Settings** area, select the **Enable Traps** check box to enable traps from the camera.
     a. **Read Community:** enter the read community name for the camera. The name is used to authenticate SNMP traffic. Only SNMP management stations with the same read community name will receive a response from the camera.
     b. **Trap Destination IP:** enter the IP address of the management station where the traps will be sent.
        In the Available Traps area, select the traps that will be sent:
        - **Temperature Alert:** a trap notification will be sent when the camera temperature rises above or falls below the supported threshold. A notification will also be sent when the camera temperature returns to normal.
        - **Camera Tampering:** a trap notification will be sent when the camera's video analytics detects a sudden scene change.
        - **Edge Storage Status:** a trap notification will be sent when the status of the SD card changes.
   - **SNMP v3:** Using SNMP v3, you can request status information through an SNMP Get request. SNMP v3 does not support traps.
     SNMP v3 offers greater security by allowing you to set a username and password for the camera. This camera uses SHA-1 type authentication and AES type encryption.
     In the SNMP v3 Settings area, complete the following:
     a. **Username:** enter the username that the management station must use when sending the SNMP Get request to the camera.
     b. **Password:** enter the password the management station must use with the chosen username.
4. Click **Apply** to save your changes.

IP Filter

On the IP Filter page, you can control which IP addresses are able to connect to your camera.

If enabled, you have the option to limit IP addresses in 2 ways:

- Deny Access to specific IP addresses or range of addresses.
- Allow Access only to specific IP addresses or range of addresses.

IMPORTANT

If you choose to filter IP access using the **Allow Access** option, make sure that you configure the correct addresses to be allowed or you may be locked out of your camera.

1. In the left menu pane, select **Network > IP Filter**.
2. Select the **Enable IP Filter** checkbox to enable IP filtering.
3. At the top of the page, select how the camera should filter IP addresses:
   - **Allow Access**: select this option to only allow access to the specific IP address entries you will make below. Be sure that you add the correct IP address entries or you may be locked out of your camera.
   - **Deny Access**: select this option to deny access to the specific IP address entries you will make below. This is the default option.
4. Add all the IP Filter Entries that you would like to either deny or allow access:
   a. In the **IPv4, IPv6 or CIDR range** field that appears, enter the IPv4, IPv6 or CIDR range of IP addresses that you would like to filter.
   b. Click **+** to add additional entries to the IP filter list and continue to add additional entries to the list until you have added all of the necessary IP addresses to be filtered.

   TIP

   You can add up to 256 IP Filter Entries.
5. Click **Apply** to save your settings.

   NOTE

   If you have denied or not allowed access to the IP address you are currently using to connect to your camera, your web interface connection will close after you click **Apply**.
6. Click **Restore Defaults** and then click **Apply** to restore the IP Filter to it's default settings.

Security Settings

For greater network communication security, you can enable compliance with the Federal Information Processing Standard (FIPS) 140-2 Level 1 or Level 3 Security Requirements for Cryptographic Modules for server and camera communication.

NOTE

- FIPS 140-2 Level 1 requires the purchase of a FIPS camera license.
- FIPS 140-2 Level 3 on cameras with an onboard TPM requires the purchase of a FIPS camera license.
- FIPS 140-2 Level 3 on cameras without an onboard TPM requires the purchase of a CRYPTR micro card. The CRYPTR card must be inserted into the camera's SD card slot before it can be enabled.

1. In the left menu pane, select **Network** > **Security** to navigate to the Security Settings page.
2. In the Encryption Engine drop-down list, select the type of encryption to use:
   - **OpenSSL** is the default option for encryption.
   - **FIPS 140-2** enables FIPS 140-2 level 1 encryption.
   - **NXP TPM** enables the onboard trusted platform module (TPM) to securely store your encryption keys. Only cameras that come with the onboard NXP TPM will display this option.
   - **CRYPTR micro** enables the installed CRYPTR card to securely store your keys, meeting FIPS 140-2 level 3 requirements.
     Note that the H6SL cameras come with the onboard TPM option and do not support the CRYPTR cards.

     IMPORTANT

     Switching the setting to CRYPTR micro will cause the camera to generate a new key and self-signed certificate. Some certificate and key management may be required when you enable this setting. If your previous keys were signed by a certificate authority (CA), the newly generated keys will also need to be signed by the CA to keep the connection to your camera secure.
     The Camera Configuration Tool (CCT) can be used to generate a Certificate Signing Request (CSR) from the camera and to upload the signed certificate back to the camera. For more information, see the *Camera Configuration Tool User Guide*.
3. Click **Apply** to save your settings.

   IMPORTANT

   Changing this setting on your camera will require your camera to reboot and you will lose the video stream for that time. Avigilon recommends that you apply this setting during non-critical operating times.

Once CRYPTR encryption is enabled, you can access the **CryptR Log** page by selecting it in the side menu. When the CRYPTR micro's internal audit log reaches 80% capacity, entries are automatically pulled from the CRYPTR micro, logged to the camera's syslog, and the CRYPTR micro's audit log is cleared out. The **CryptR Log** page will only show entries that haven't been logged to the camera's syslog yet.

NOTE

If the CRYPTR micro card is ejected or becomes unusable while it is inserted in the camera and enabled, the camera will restart in FIPS 140-2 mode. If the card is re-inserted into the camera, CRYPTR micro will need to be re-selected as the Encryption Engine to continue using the CryptR micro card to store your keys.

Managing Certificates

On the *Certificates* page, administrators can manage certificates. Certificates are used to authenticate devices and encrypt communication over the network.

In the *Certificates* area, you can view the following information:

- *Cert ID*: Used to uniquely identify the certificate.
- *Subject*: The entity a certificate belongs to: a machine, an individual, or an organization.
- *Issuer*: The entity that verified the information and signed the certificate.
- *Algorithm*: This contain a hashing algorithm and a digital signature algorithm.
- *Expiry Date*: The date when the certificate expires.
- *Type*: The type of certificate, i.e., trusted or not trusted.

Downloading Certificates

1. To download a Certificate, select it from the list.
2. Click the **Download** button.
   Certificates are downloaded as .pem files.

Removing Certificates

1. To remove a Certificate, click the **Remove** button.
2. Click the **OK** button.

Downloading Certificate Signing Requests

1. To download the Certificate Signing Request (CSR), click the download **CSR button** and enter the following information:
   - *Common Name*: The primary hostname of the server. This field is required.
   - *Subject Alternative Name (DNS)*: The alternative values associated with the certificate, e.g., email address, IP addresses, URIs, DNS names.
   - *Organizational Unit*: The name of the unit within the organization that is requesting the certificates.
   - *Organization*: The name of the organization requesting the certificates.
   - *Locality*: The geographic locality of the organization.
   - *State or Province*: The State (United States) or Province (Canada) associated with the organization.
   - *Country*: The Country where the organization is located.
2. Click the **Download** button to download the CSR file.

Uploading Certificates

1. To upload a certificate, click **Upload Cert**.
   a. *Certificate*: click **Choose File** to upload a certificate.
   b. *Private key*: click **Choose File** to upload a private key.
   c. *Private key password*: enter the private key password.
2. Click the **Upload** button to upload the Cert.

Uploading CA Certificates

1. Click the **Upload** button to upload the certificate.
2. To upload a CA certificate, click **Upload CA Cert**.
   a. *CA Certificate*: click **Choose File** to upload a CA certificate.
   b. *CA Certificate ID*: enter the CA certificate ID.
3. Click the **Upload** button to upload the CA certificate.

Creating Certificates

1. In the *Valid Not Before* field, enter the date that the certificate becomes valid in the format: mm/dd/yyy. This field is required.

   NOTE

   You can also click the calendar icon to select a date using the calendar view.

2. In the *Valid Not After* field, enter the date that the certificate is no longer valid in the format: mm/dd/yyyy. This field is required.
3. Enter the following information:
   - *Common Name*: The primary hostname of the server. This field is required.
   - *Subject Alternative Name (DNS)*: The alternative values associated with the certificate, e.g., email address, IP addresses, URIs, DNS names.
   - *Organizational Unit*: The name of the unit within the organization that is requesting the certificates.
   - *Organization*: The name of the organization requesting the certificates.
   - *Locality*: The geographic locality of the organization.
   - *State or Province*: The State (United States) or Province (Canada) associated with the organization.
   - *Country*: The Country where the organization is located.
4. Click the **Create** button.
5. Click the **Make Active** button.
6. Click the **OK** button in the pop-up message.

   IMPORTANT

   If you activate the new certificate other certificates will be deactivated, and the page will be reloaded.

Image and Display

TIP

Features and options are disabled if they are not supported by the camera.

NOTE

If a camera with video analytics or unusual motion detection is physically moved or adjusted, or if the focus or zoom level is changed, reset the learning progress to provide accurate results. If the camera's image rate and compression or display settings are updated, the learning progress may reset automatically.

On the Image and Display page, you can control the camera’s day/night and exposure settings.

The Image and Display page includes an image panel that displays the camera's live video stream. When you click **Apply** to save your changes, the video stream is updated to use the new settings.

Below the image panel, the following information is displayed on the right:

- Current Exposure
- Current Gain
- Current Iris
- Last Known Light Level

Many Avigilon High Definition IP cameras have electronic zoom and focus controls, and you can set the camera's zoom and focus through this page as well.

1. For H6SL cameras, you can change the size and location of the **Auto Focus Zone** by clicking and dragging the orange **Auto Focus Zone** box on the camera's field of view.

   > **TIP**
   > Auto Focus zones are visible by default. If the Auto Focus Zone is not visible on the camera's field of view, make sure the **Show Auto Focus Zones** checkbox is selected.

2. If you are configuring an H6A or H6X camera, you can change the size and location of the **Auto Focus Zone** by clicking and dragging the orange **Auto Focus Zone** box on the camera's field of view.

   > **TIP**
   > Auto Focus zones are visible by default. If the Auto Focus Zone is not visible on the camera's field of view, make sure the **Show Auto Focus Zones** checkbox is selected.

3. Use the **Zoom** slider to adjust the camera's zoom position.
   - To zoom in, move the slider towards the right.
   - To zoom out, move the slider towards the left.
4. To manually focus the camera, use the **Focus** buttons:
   - To focus towards zero:
     - Click **<<** to take a large step.
     - Click **<** to take a small step.
     - Click **0** to focus at zero.
   - To focus towards infinity:
     - Click **>>** to take a large step.
     - Click **>** to take a small step.
     - Click **Inf** to focus at infinity.
   - If available, click **Auto Focus** to let the camera focus itself.

     > **NOTE**
     > Once the focus is manually set, it will not change.

5. If the camera becomes defocused while in monochrome mode at night, adjust the **IR Focus Offset** slider to compensate for the focus shift caused by the built-in or external IR illuminators.
6. Use the **Image Rotation** drop-down selector to rotate the video image. The default option is **None**. The image can be rotated by 90 degrees, 180 degrees or 270 degrees. The camera will reboot when applying this setting and some encoding settings will revert to their default settings.

   NOTE

   Image rotation should not be combined between the camera and VMS image rotation settings. Perform the image rotation either in the camera or in the VMS, but not both.

7. If available, select the check box to enable **Temperature Refocus**. When enabled, the camera will automatically refocus as temperature fluctuates.

   IMPORTANT

   Auto focus zones are used to automatically focus the camera as temperature fluctuates. Ensure the zone contains sufficient contrast during both the day and night.

8. To set how the camera compensates for the environmental lighting conditions, define the following settings:
   - **Day/Night Mode:** Use the Day/Night Mode drop-down list to set how the video image switches between day and night mode.
     - **Automatic**: When the light level is above the day/night threshold, the video image will be in color. When the light level goes below the day/night threshold, the camera will automatically open the IR cut filter and switch to monochrome mode. If IR illuminators are enabled, they also turn on.
     - Check the **Restore Automatic after Timeout** box to automatically restore the Day/Night mode to **Automatic** after a certain timeout period. The **Timeout** field can be assigned a value between 5s and 3600s for the timeout period.
     - Use the **Day/Night Threshold** slider to set the day/night threshold. Move the slider to select the light level when the camera switches between day mode and night mode. The slider is only available when the Day/Night Mode setting is set to **Automatic**.
       The slider may display one of the following values:
       - **Day/Night Threshold (EV):** The slider value is in Exposure Values (EV).
         In day mode, the last known light level is displayed under the image panel and is also shown as a blue bar on the Day/Night Threshold slider.
       - **Day/Night Threshold (gain dB):** The slider value is in decibels (dB).
     - Use the **Hysteresis** setting to refine the threshold offset.
       - Choose **Low** when the camera should switch from day to night in scenes where the difference between light and dark levels are small.
       - Choose **High** when the camera should switch modes when the difference between light and dark levels are large.
       - The default value is **Medium**.
     - **Color**: The video image will always be in color.
     - **Monochrome**: The video image will always be monochrome.

- **External**: The camera will open the IR cut filter and switch to monochrome mode based on the digital input circuit state.

  > **NOTE**
  >
  > The default digital input circuit state is configured on the Digital Inputs and Outputs page. For more information, see *Digital Inputs and Outputs* on page xliii.

- **Day/Night Delay (seconds)**: Set the delay time, in seconds, before the Day/Night mode switch is made once the set threshold is reached.
- **Enable IR LED in Night Mode:** You can manually enable or disable the IR illuminators that are installed on the camera. If unchecked, the IR LEDs will not turn on in Night mode.
- **Enable Adaptive IR Compensation:** You can enable automatic infrared adjustments through Adaptive IR Compensation. This allows the camera to automatically adjust the video image for saturation caused by IR illumination.
- **Show Auto Contrast ROI:** Enabling this option allows you view and select the region of interest. The contrast is automatically adjusted based on the selected region.
- **Enable Night Visibility Check:** You can manually enable or disable the night visibility check on a camera. The night visibility check, when enabled, performs a periodic test switching between day/night mode to check if there is sufficient light level to switch from night mode to day mode. When disabled, the camera will use a less optimal method to determine if the light level is sufficient to switch to day mode.

  > **NOTE**
  >
  > Disabling the night visibility check could delay the camera from transitioning between night and day modes and make the transition time less optimal. For example, the camera stays in night mode 30 minutes longer than it needs to.

- **Fast Night To Day Switch:** Enable this option to speed up the time cameras take to switch between day and night modes. When this option is enabled, switching between day and night modes will take 2-3 seconds. Currently this option is only available on H5SL cameras.

  > **NOTE**
  >
  > This option is disabled by default. It is recommended that you do NOT enable this option on cameras that are installed in locations where additional light sources (such as headlights, floodlights, and streetlights) may cause the camera to frequently switch between day and night modes.

9. To adjust the exposure of the image, adjust the Exposure Settings:
   - **Flicker Control:** If your video image flickers because of fluorescent lights around the camera, you can reduce the effects of the light by setting the Flicker Control to the same frequency as your lights. Generally, Europe is **50Hz** and North America is **60Hz**.

     > **NOTE**
     >
     > Resetting this control will stop the video stream for a few seconds.

- **Enable Wide Dynamic Range:** You can enable automatic color adjustments through Wide Dynamic Range (WDR). This allows the camera to adjust the video image to accommodate scenes where bright light and dark shadow are clearly visible.
- **Exposure:** You can allow the camera to control the exposure by selecting **Automatic**, or you can set a specific exposure rate.

  > **NOTE**
  >
  > Increasing the manual exposure time may affect the image rate.

- **Exposure Offset:** This is an advanced setting that allows you to compensate for unusual lighting conditions by setting an exposure offset value. Negative values result in a persistently darker image, and positive values result in a persistently brighter image.
- **Maximum Exposure:** You can limit the automatic exposure setting by selecting a maximum exposure level. The Maximum Exposure drop-down list is only available when the Exposure setting is set to Automatic.
  By setting a maximum exposure level for low-light situations, you can control the camera's exposure time to let in the maximum amount of light without creating blurry images.
- **Priority:** You can set **Max Image Rate** or **Exposure** as the priority.
  - When set to **Max Image Rate**, the camera will maintain the set image rate as the priority and will not adjust the exposure beyond what can be recorded for the set image rate.
  - When set to **Exposure** the camera will maintain the exposure setting as the priority, and will override the set image rate to achieve the best image possible.
- **Maximum Iris:** You can limit the largest iris opening the lens will use by setting a maximum iris opening. This value is an f-number. It is also given in EV relative to the widest possible opening of the lens. This setting is only available when the **Iris** setting is set to **Automatic**.
  The iris opening also affects how much of the scene is in focus. The smallest f-number (0 EV) sets the iris to the widest possible opening. This allows the most light into the camera, but places less of the scene in focus. Larger f-numbers (negative EV) result in a smaller maximum opening, placing more of the scene in focus. The camera will automatically correct for the decreased light by using a higher gain or a longer exposure time.
- **Preferred Iris:** You can set an ideal iris opening to give a well-exposed and well-focused image in the most frequent lighting conditions. This value is an f-number. It is also given in EV relative to the widest possible opening of the lens. This setting is only available when the **Iris** setting is set to **Automatic**.

  > **NOTE**
  >
  > The Preferred Iris value must be less than or the same as the Maximum Iris value.

  The smallest f-number (0 EV) sets the iris to the widest possible opening. This allows the most light into the camera, but places less of the scene in focus. Larger f-numbers (negative EV) result in smaller openings, placing more of the scene in focus. The camera will automatically correct for the decreased light by using a higher gain or a longer exposure time.
- **Backlight Compensation:** If your scene has areas of intense light that cause the overall image to be too dark, you can enable Backlight Compensation to achieve a well-exposed image.
- **Iris:** You can allow the camera to control the iris by selecting **Automatic**, or you can manually set it to **Open** or **Closed**.

- **Maximum Gain:** You can limit the automatic gain setting by selecting a maximum gain level. By setting the maximum gain level for low-light situations, you can maximize the detail of an image without creating excessive noise in the images.
- **Equalization:** This setting allows you to adjust the camera image to equalize the color difference between warm and cold objects. A lower value will make the warm objects more noticable. Increasing the value will result in a more balanced video image.

10. If you are configuring an H6A or H6X camera, you can select the **Enable Image Stabilization** checkbox in the Advanced Filters area to enable Electronic Image Stabilization (EIS).
    Electronic Image Stabilization (EIS) automatically stabilizes the image whenever the camera shakes. This feature improves the image quality by compensating for camera movement.

    NOTE

    Image stabilization can not be enabled at the same time as: Wide Dynamic Range (WDR), Dynamic Privacy Masks or Privacy Zones on this camera.

11. Click **Apply** to save your changes.

Adjustments

On the Adjustments page, you can control the video image color, contrast, and brightness settings.

The Adjustments page also includes an image panel that displays the camera's live video stream. When you click **Apply** to save your changes, the video stream is updated.

TIP

Features and options are disabled if they are not supported by the camera.

1. In the left menu pane, select **Image and Display > Adjustments**.
2. Adjust the video image as required.
   You can either use a preset configuration, or you can create your own custom configuration. Use the **Preset** drop-down list to select the preferred configuration:
   a. **Avigilon:** This preset provides the recommended balance of brightness and color for video surveillance.
   b. **Standard:** This preset is configured for general day/night changes in an indoor or outdoor scene.
   c. **Vivid:** This preset provides increased color and brightness for a more saturated image.
   d. **Custom:** Select this option to manually adjust the following image settings:

      NOTE

      The Brightness and Contrast settings are disabled if Wide Dynamic Range is enabled.

- **Saturation:** You can adjust the video's color saturation by entering a percentage number. 0 creates a black and white image, while 100 creates intense color images.
- **Sharpness:** You can adjust the video's sharpness by entering a percentage number. 0 applies the least amount of sharpening, while 100 applies the most sharpening to make the edges of objects more visible.
- **Brightness:** You can adjust the video's brightness by entering a percentage number. 0 creates a dark image, while 100 creates a light-filled image.
- **Contrast:** You can adjust the video's contrast by entering a percentage number. 0 applies the least amount of contrast, while 100 applies the most contrast between objects in the image.

3. Use the **White Balance** drop-down list to select how the white balance settings are controlled:
   - **Automatic**: The camera will automatically control the white balance.
   - **Custom**: Manually set the **Red** and **Blue** levels.

   Dominant Color Compensation (if available): This option enables an alternate auto white balance algorithm which should be used when a large area in the field of view contains one color. For example, a camera that is overlooking a grass field. For this example, the Dominant Color Compensation white balance mode will improve the white balance to a more neutral color.
4. Move the **Temporal Filter Strength** slider slightly to the left or right to adjust the amount of noise vs. blur in the scene. A temporal filter reduces image noise by averaging the noise over several frames.

   TIP

   Start by making small adjustments only because applying excessive changes may degrade the overall image quality.

   If the image looks noisy, move the slider to the right to reduce the amount of noise in the scene and decrease the bandwidth used.
   If the image looks blurry, move the slider to the left to reduce the amount of blur in the scene and increase the bandwidth used.
   By default, the slider is set to the middle, or 50.
5. Click **Apply** to save your changes.

Compression and Image Rate

On the Compression and Image Rate page, you can change the camera's compression and image quality settings for sending video over the network. You can change the camera's compression and image quality settings separately for primary, secondary, tertiary and quaternary streams.

NOTE

Quaternary steams are only available on H6SL 5MP camera models at this time.

> **NOTE**
>
> If a camera with video analytics or unusual motion detection is physically moved or adjusted, or if the focus or zoom level is changed, reset the learning progress to provide accurate results. If the camera's image rate and compression or display settings are updated, the learning progress may reset automatically.

To enable easy access and lower bandwidth usage, the web interface only displays video in JPEG format. The settings on this page only affect the video transmitted to the network video management software.

Avigilon High Definition IP cameras have multi stream capabilities. If the camera's streaming format is set to H.264 or H.265, the camera's web interface can still display live video in JPEG format.

> **NOTE**
>
> The camera may automatically adjust compression quality in order to abide by the bandwidth cap specified.

> **IMPORTANT**
>
> Adjusting the stream settings with HDSM enabled and connected to Avigilon Control Center (ACC) or Avigilon Unity Video (AUV) may cause undesired behavior in camera operation and missing recordings. Camera stream settings should only be configured in ACC or AUV.

Follow these steps for each of the streams to change the compression and image quality settings for each stream:

1. In the **Format** drop-down list, select the preferred streaming format for displaying the camera video in the network video management software.
   If you are using the Onboard Storage feature, select **H.264** or **H.265**. For more information, see *Enabling Onboard Storage* on page xl.
2. In the **Max Image Rate** field, enter how many images per second you want the camera to stream over the network.

   > **NOTE**
   >
   > Adjusting the image rate across the 30 fps boundary will stop the video stream for a few seconds.

   If the camera is operating in High Framerate mode, then the maximum image rate is increased. For more information on the High Framerate mode, see *General* on page xi.
3. In the **Max Quality** drop-down list, select the desired image quality level.
   Image quality setting of 1 will produce the highest quality video and require the most bandwidth.
4. In the **Max Bitrate** field, enter the maximum bandwidth the camera can use.
5. In the **Primary Resolution** drop-down list, select the preferred image resolution.
6. In the **Min Keyframe Interval** field, enter the number of frames between each keyframe.

7. For H6X Box cameras, you can select the **Enable Cropped Quantanary Stream** checkbox to enable a fixed resolution to the quantanary stream with center cropped portion of the image with aspect ratio of 5:9. The quantanary stream resolution will remain at 400x720. You can still adjust the other streams resolutions
8. Click **Apply** to save your changes.

Enabling HDSM SmartCodec™ Technology Settings

You can enable and configure HDSM SmartCodec settings on the *Video Configuration* page. HDSM SmartCodec helps isolate objects from the background areas. This reduces the camera's bandwidth usage by concentrating on the subjects of interest.

HDSM SmartCodec is turned off by default.

> **NOTE**
>
> Additionally, advanced settings can also be updated on the HDSM SmartCodec Advanced Settings page. For more information, see *HDSM SmartCodec Technology Advanced Settings* on the next page.

1. Select the **Enable** check box to enable the HDSM SmartCodec feature.
2. Enabling HDSM SmartCodec will turn on Idle Scene Mode. Uncheck the **Idle Scene Mode** checkbox to turn off this feature.
3. In the **Min Image Rate** field, enter how many images per second you want the camera to stream when there is no motion in the scene.
4. In the **Idle Keyframe interval** field, enter the number of frames between each keyframe (between 1 and 254) when there is no motion in the scene.
5. In the **Bandwidth Reduction** drop-down list, select one of the options:
    - **Low**
    - **Medium** (recommended)
    - **High**
    - **Custom**
6. Click **Apply** to save your changes.

Viewing the RTSP Stream URI

On the Compression and Image Rate page, you can also generate the camera's real time streaming protocol (RTSP) address. The RTSP Stream URI allows you to watch the camera's live video stream from any application that supports viewing RTSP streams, including many video players.

> **NOTE**
>
> You can only generate the RTSP stream address in the camera web interface.

1. If the Generate RTSP Stream URI button is not available, the RTSP stream URI is auto-generated.
   In the RTSP Stream URI area, the auto-generated URIs are displayed:
   - **Unicast** – select this option if you only plan to view the video stream from one video player at a time.
   - **Multicast** – select this option if you plan to view the video from more than one video player simultaneously.
     To view the RTSP stream:
     a. Copy and paste the generated address into your video player. DO NOT open the live video stream yet.
     b. Add your username and password to the beginning of the address in this format:
        rtsp://<username>:<password>@<generated RTSP Stream URI>/
        For example: `rtsp://admin:admin@192.168.1.79/defaultPrimary?streamType=u`
     c. Open the live video stream.
2. To watch the camera's live video stream from an external video player, click **Generate RTSP Stream URI**.
   The generated address is displayed at the bottom of the RTSP Stream URI area.

Configure Multicast Streaming

Multicast streaming delivers a continuous stream of footage to multiple endpoints simultaneously. Cameras with multiple streams can stream to the multiple endpoints using different IP addresses and port numbers.

You can configure the primary, secondary and tertiary streams separately in the *Multicast* area on the *Compression and Image Rate* page of the camera web interface. You can also adjust settings for a quaternary stream for the H6SL 5MP camera models.

Follow these steps to configure multicast streaming settings for the streams as required:

1. Enter the IP address in the **Address** field.
2. Enter the port number in the **Port** field.
3. Enter a value between 1 and 255 seconds in the **Time To Live** field.

Accessing the Still Image URI

On the Compression and Image Rate page, you can access the last still image frame that the camera recorded.

- To access the still image, click the URI link in the Still Image URI area.

The last recorded frame of video from the camera's secondary stream is displayed. You can choose to save or print the image directly from the browser.

HDSM SmartCodec Technology Advanced Settings

On the HDSM SmartCodec Technology Advanced Settings page you can select settings for both motion and idle scenes. Other HDSM SmartCodec technology settings can be selected under HDSM SmartCodec technology Settings on the Compression and Image Rate page. For more information, see *Enabling HDSM SmartCodec™ Technology Settings* on the previous page.

1. In the left-menu pane, select **Compression and Image Rate > Advanced**.
2. In the **Background Quality** field in the **On Motion** section, enter the compression quality for the background (between the default of 6 and the lowest setting of 20).
3. In the **Post-motion delay** field in the **On Idle Scenes** section, enter the delay (in seconds) after motion has ended before the camera drops into idle scene settings (between 5 and 60).
4. In the **Image Rate** field in the **On Idle Scenes** section, enter the encoding frame rate (images per second) when there is no motion in the scene.
5. In the **Quality** field in the **On Idle Scenes** section, enter the compression quality when there is no motion in the scene (between 6 and 20).
6. In the **Max Bitrate** field in the **On Idle Scenes** section, enter the maximum number of kilobytes per second when there is no motion in the scene.
7. In the **Keyframe Interval** field in the **On Idle Scenes** section, enter the number of frames between each keyframe when there is no motion in the scene (between 1 and 254 frames).
8. Click **Apply** to save your changes.

Streaming Settings

On the *Streaming Settings* page, you can set the ONVIF Media Profile and configure Profile Settings.

1. Select an **ONVIF Media Profile** from the **Profiles** drop-down menu.
2. Select a profile from the **Video Source** drop-down menu.
3. Select a profile from the **Video Encoder** drop-down menu.
4. Select a profile from the **Audio Source** drop-down menu.
5. To enable **Metadata**, select metadata0 from the drop-down menu.
6. To disable **Metadata**, select None.
7. Click the **Apply** button to apply your changes.

Motion Detection

On the Motion Detection page, you can define the green motion detection areas in the camera's field of view. Motion detection is ignored in areas not highlighted in green.

To help you define motion sensitivity and threshold, motion is highlighted in red in the image panel.

NOTE

This motion detection setting configures pixel change detection in the camera's field of view. If you are configuring an Avigilon video analytics camera, you will need to configure the detailed analytics motion detection and other video analytics features through the AvigilonControl Center Client software. For more information, see the *AvigilonControl Center Client User Guide*.

1. Define the motion detection area.
   The entire field of view is highlighted for motion detection by default. To define the motion detection area, use any of the following tools:
   - Click **Clear All** to remove all motion detection areas on the video image.
   - Click **Set All** to set the motion detection area to span the entire video image.
   - To set a specific motion detection area, click **Select Area** then click and drag anywhere on the video image.
   - To clear a specific motion detection area, click **Clear Area** then click and drag over any motion detection area.
   - Use the **Zoom In** and **Zoom Out** buttons to locate specific areas in the video image.
2. In the **Sensitivity** field, enter a percentage number to define how much each pixel must change before it is considered in motion.
   The higher the sensitivity, the smaller the amount of pixel change is required before motion is detected.
3. In the **Threshold** field, enter a percentage number to define how many pixels must change before the image is considered to have motion.
   The higher the threshold, the higher the number of pixels must change before the image is considered to have motion.
4. If the camera is connected to a third-party video management system (VMS), check the **Enable Onvif MotionAlarm Event** check box.
5. Once enabled, the H.264 camera can send motion alarm information to the VMS according to the appropriate ONVIF protocol.
6. Click **Apply** to save your changes.

Tamper Detection

On the Tamper Detection page, you can set how sensitive the camera is to tampering.

To set the options for tampering:

1. In the **Sensitivity** field, enter a number between 1 and 10 to define how sensitive the camera is to a sudden change in the scene. The higher the setting, the more sensitive the camera is to detect scene changes.

   NOTE

   A sudden change in the scene is usually caused by someone unexpectedly moving the camera. Lower the setting if small changes in the scene, like moving shadows, trigger too many tampering events. If the camera is installed indoors and the scene is unlikely to change, you can increase this setting to capture more unusual events.
2. In the **Trigger Delay** field, enter the number of seconds (up to 30 seconds) that the tamper condition must persist in the scene before the tamper event is sent.
3. Click **Apply** to save your changes.

Analytics Configuration

On the *Analytics* page, you can create analytic events and enable, suspend and reset self-learning analytics. You can also change the the analytics scene mode to optimize camera analytics.

Create Analytic Events

You can edit the Classified Motion Detection event and create motion analytic events on the *Analytics* page.

Classified Object Motion Detection

Once Classified Object Motion Detection is enabled, you can configure the rule and adjust the inclusion area. The inclusion area is shown as the green box overlaying the camera field of view. You can also add and arrange inclusion areas to make sure that the site is fully monitored.

1. Click **Edit** next to Classified Object Motion Detection in the *Events* area.
2. The default rule name is Smart Motion Rule. You can not edit the name of the rule.
3. Select one or more object types from the list of options: At least one object type is required.
    - Person
    - Vehicle
        - Car
        - Bus
        - Bicycle
        - Motorcycle
        - Pickup
        - Truck
        - Large
        - Truck
        - Van
4. Click and drag the slider to adjust the **Sensitivity** level. Lowering the sensitivity increases the chances of false negatives.
5. Use the up and down arrows to set the **Threshold Time** required to trigger an alarm.
6. Objects within the Inclusion area for longer than the threshold time will trigger an alarm.
7. Use the up and down arrows to set the **Timeout** before another alarm is triggered.
8. Click and drag the middle of the green square on the screen to move the inclusion area.
9. Click and drag the points to reshape the inclusion area.
10. Click **Add Exclusion Area** to add a new exclusion area.
11. Click **Reset Inclusion Area** to reset the size and shape of the inclusion area.
12. Select an Inclusion Area and click **Delete Exclusion Area** if you want to delete it.

    NOTE

    At least one Inclusion area is required.
13. Click **Save**.

Create a Motion Analytic Event

You can create Motion Analytic Events on the *Analytics* page. Motions Events trigger alarms when a certain activity occurs in the inclusion area. You can also add and arrange inclusion areas to make sure that the site is fully monitored.

1. Click **Add Event** in the Events area.
2. Enter a name for the Event in the Name field.
3. You can uncheck the **Enabled** checkbox if you want to enable it at a later time. The Enabled checkbox should remain checked if you want the event to be enabled immediately.
4. Select an activity type from the list:
    - Objects in area
    - Object loitering
    - Objects crossing beam
    - Object appears or enters area
    - Object not present in area
    - Objects enter area
    - Objects leave area
    - Object stops in area
    - Direction violated
5. Select one or more object types from the list of options: At least one object type is required.
    - Person
    - Vehicle
    - Car
    - Bus
    - Bicycle
    - Motorcycle
    - Pickup
    - Truck
    - Large
    - Truck
    - Van
6. Click and drag the slider to adjust the **Sensitivity** level. Lowering the sensitivity increases the chances of false negatives.
7. Use the up and down arrows to set the **No. of Objects** required to trigger an alarm.
8. Use the up and down arrows to set the **Threshold Time** required to trigger an alarm.
9. Objects within the Inclusion area for longer than the threshold time will trigger an alarm.
10. Use the up and down arrows to set the **Timeout** before another alarm is triggered.
11. Click and drag the middle of the green square on the screen to move the inclusion area.
12. Click and drag the points to reshape the inclusion area.
13. Click **Add Exclusion Area** to add a new exclusion area.
14. Click **Reset Inclusion Area** to reset the size and shape of the inclusion area.
15. Select an Inclusion Area and click **Delete Exclusion Area** if you want to delete it.

NOTE

At least one Inclusion area is required.

16. Click **Save**.

Enable Audio Analytics

> **NOTE**
> This feature is only available on H6A and H6X camera models at this time.

> **IMPORTANT**
> In some countries or jurisdictions, there are strict rules about audio recording, particularly the recording of conversations, as this can be considered personally identifiable information (PII) under some privacy legislation. Before configuring these audio features, ensure that your use of these audio features complies with any applicable local and national laws and guidance.

You can enable and configure Audio Detection for different Audio Detection Events on the Audio Analytics page. This option is disabled by default. The camera's microphone is disabled by default and must be physically switched on for Audio Detection to work.

1. Select the **Enable Audio Detection** checkbox to enable the camera to detect Audio Detection Events.
2. Click **Apply**.
3. Select a sound from the list:

   > **NOTE**
   > The sounds listed under **Basic Sounds** are available without a premium license. The sounds listed under **Premium Sounds** are only available with a premium license. For more information, see *Licensing* on page I.

   - Scream
   - Glass Break
   - Car Alarm
   - Fire Alarm
   - Dog Bark
   - Tire Screech
   - Loud Noise
   - Ultrasound
   - Gunshot
4. Under Event Details, select the **Enabled** checkbox to enable Audio Detection Events.
5. Select a Sensitivity level from the drop-down list:
   - Low: a lower setting means it requires a lower confidence level to trigger an alarm.
   - Medium: a medium setting means it requires a medium confidence level to trigger an alarm.
   - High: a higher setting means it requires a higher confidence level to trigger an alarm.

6. Adjust Timeout by entering a value between 1 and 300 seconds. Timeout refers to the minimum interval of time after an audio event is detected before the system triggers an additional alarm.

   IMPORTANT

   During the Timeout interval, subsequent audio events, e.g., gunshots, will not trigger separate alarms.

7. Click **Apply** to save your changes.

Configure Self Learning Analytics

You can configure Self Learning Analytics on the *Analytics* page. The camera will perform self adjustments based on the activity in the field of view. This can significantly improve the accuracy of classified object detection.

Self-learning will progress based on activity detected in the field of view. Scenes with less activity will require staging during the learning phase. One example of staging would involve having a person walk through the field of view during learning.

1. Select the **Enable Self Learning** checkbox to enable self learning analytics.
2. Select the **Suspend Self Learning** checkbox to temporarily disable self learning analytics.
3. Click the **Reset Self Learning** button to reset self learning.

   IMPORTANT

   This action can not be undone.

4. Click **Apply** to save your changes.

Suspend Self Learning

You can now stop the self-learning video analytics from continuing to learn the scene so that the camera continues to recognize objects correctly based on previous learnings and does not degrade its detection of objects when left to operate in sparse scenes.

The following scenarios are examples of when self learning should be suspended:

- People or vehicles are not expected in the device's field of view.
- Objects move at different heights. For example, overhead pedestrian bridges, train platforms, hills and underpasses.
- The device is in Indoor Overhead mode. Self learning is not used, even if enabled. All detected objects are classified as people.

Reset Self Learning

When the learning progress is reset, all learning data is cleared and the device needs to re-learn the scene. This prevents missed and false detections based on old data.

NOTE

Always reset Self Learning after a camera is physically moved or adjusted, or if the focus or zoom level is changed.

Extended Settings

On the Extended Settings page, you can configure ONVIF Settings.

1. Select the **Enable Multi-Packet XML Documents** checkbox to enable multi-packet XML documents to reduce metadata size. Only for Video Management systems that support multi-packet XML documents.
2. Select the **Enable Analytics Options Requests** checkbox to enable the GetAnalyticsModuleOptions and GetRuleOptions Requests.
3. Select the **Enable Analytics XML Metadata** checkbox to send analytics metadata in the XML metadata stream.
4. Select the **Enable Run-Length Encoding of Motion Mask** checkbox to enable run-length encoding of the motion mask. Only for Video Management Systems that do not require an un-encoded mask.
5. Select the **Enable Supplemental Events** checkbox to send supplemental events not defined by ONVIF that may be useful to some Video Management Systems.
6. Select the **Enable Singleton Analytics Events** checkbox to send singleton Analytics events instead of property events.
7. Click **Apply** to save your changes.

Privacy Zones

On the Privacy Zones page, you can set privacy zones in the camera's field of view to block out areas that you do not want to see or record. You can also create removable privacy zones that are blurred instead of opaque. The removable privacy zones are only applied to the secondary and tertiary video streams. This allows for ACC group and privilege settings to define which users can view the primary stream without the removable privacy zones and which users can only view the streams with the blurred privacy zones. For more information, see *Setting a Removable Privacy Zone for Specific Users* on the next page.

The camera supports up to 64 privacy zones. Up to 16 of these zones can be used as removable privacy zones.

Setting a Privacy Zone

1. To add a privacy zone, click **Add**. A privacy zone box is added to the video image.
2. To define the privacy zone area, perform any of the following:
    a. Drag any side or corner of the box to resize the privacy zone. Privacy zones can only be rectangular in shape. Multiple privacy zones can be used to obscure other shapes.
    b. Click inside the box and drag to move the privacy zone.

3. To set the privacy zone as removable:
    a. Click the **Enable** checkbox in the **Removable Blur** settings.
    b. Use the **Blurriness** slider to define amount of blur in the privacy zones. All Blurriness settings will make the video from that zone completely obscured.

    > **NOTE**
    > Removable privacy zones have diagonal lines in them when configuring them on the Privacy Zones page to help tell them apart from regular privacy zones. When viewed in the Live View page or an ACC client, the zone will appear as a blurred gray rectangle.

4. Click **Apply** to save the privacy zone settings.

Deleting a Privacy Zone

Click the **X** at the top-right corner of the gray box to delete the privacy zone. Alternatively, you can select the privacy zone you want to delete from the list and click **Remove**.

Setting a Removable Privacy Zone for Specific Users

This is only supported when connecting the camera to an ACC system. Removable privacy zones are only applied to the secondary and tertiary video streams so that ACC group and privilege settings can be used to define which users can view the primary stream without the privacy zones and which users can only view the streams with the blurred privacy zones.

> **NOTE**
> The removable privacy zones will be applied to the secondary and tertiary video streams for any VMS the camera is connected to. Other VMS systems may have similar user privilege settings that can be used as a similar method to define which stream users can view. Check your VMS documentation for how to configure which streams users have access to view.

The ACC View high-resolution images group privilege gives users in that group access to the primary high-resolution stream of the cameras. This primary high-resolution stream will not have the removable privacy zones applied to it. This privilege should only be granted to administrators or similar users that might have a need to view the private areas of the image. General operators and other ACC users that don't have the View high-resolution images privilege will always have the removable privacy zones applied. See your ACC documentation for more information on setting up group privileges.

Keep the following limitations in mind when using removable privacy zones:

- ACC High Definition Stream Management (HDSM)™ will display primary, secondary, or tertiary streams based on the zoom level and viewing portal size when viewing live or recorded video. Make sure to remove the View high-resolution images privilege from ACC users that do not need to see the unblurred video.
- Certain ACC user groups can be granted Emergency Privilege Override which can be used to see the primary unblurred video stream. This feature logs each use of the emergency override, including the username and time of access, in the ACC event logs.

- When ACC operators with access to the primary stream play back recorded video in a small video panel, they will see the blurred privacy zone. The blurred zone will disappear when the privileged operator pauses or scrubs through video on the timeline. The privileged operator can also swithc to the full screen view and/or zoom in on the video to make HDSM display the unblurred primary stream.

Dynamic Privacy Masks

NOTE

This feature is only available on H6A and H6X camera models at this time.

You can create and configure dynamic privacy masks on the *Dynamic Privacy Masks* page. Dynamic Privacy Masks blur certain objects from view in the live camera footage, recorded video and still images. The feature restricts access to sensitive information in the image.

NOTE

You must change the Camera Mode to Dynamic Privacy Masks before you can use dynamic privacy masks. You can change the camera mode on the General Settings page. You will not be able to use EIS when the camera mode is set to Dynamic Privacy Masks.

Create a Dynamic Privacy Mask

You can define both blur zones and unblur zones when you create a Dynamic Privacy Mask. You must create at least one blur zone per mask. You have the option to create unblur zones to layer on top of the blur zones. Unblur zones cancel the blurring effect when layered on top of a blur zone. Adjust the unblur zones to cover smaller sections of the blur zones to use them effectively. You must also choose which objects get blurred by selecting one or more Class Filters. The Class Filters define the types of objects that will be blurred, e.g., Human or Vehicles.

1. Click **Create Mask** in the Mask Options area.
2. Click and drag the slider to increase the Blur Radius. This enhances the blurring effect.
3. Select one or more of the checkboxes to define which Class Filters to mask.
4. The following class filters are currently available:
    - Human
    - Vehicle

    NOTE

    At least one class filter must be selected to create a mask. The Human class filter is selected by default.
5. Click **Add** in the Blur Zones column to add a new Blur Zone.

> **TIP**
>
> You can click the **Apply** button without creating any blur zones to quickly mask the entire area. Make sure to click **OK** to confirm.

6. Click **Add** in the Unblur Zones column to add a new Unblur Zone.
7. Click the zone to select it. The blue zone is the one you have currently selected.
8. Click and drag the middle of the zone to move it to a new location.
9. Click and drag the blue points to modify the size or shape of the zone.

> **NOTE**
>
> The zone must resemble a single valid polygon to apply effectively. Make sure the shape of the zone does not appear twisted.

10. Click on the edge of the zone to create a new point.
11. Select a zone from either column and use the **Remove** buttons if you want to delete it.

> **NOTE**
>
> Make sure you know which zone you have selected before you click Remove.

12. Click **Apply** to save the mask.
13. Click **Remove Mask** and then click **Apply** if you want to delete the mask.

Storage

On the Storage page, you can enable the camera's onboard storage feature and download recorded video directly from the camera. Onboard storage is available only on cameras equipped with an SD card or microSD card slot.

> **IMPORTANT**
>
> SD card failures can cause the camera to continuously reboot. To prevent this, the SD card will be disabled if persistent failures are detected. For more information, see *SD Card Failures* on page xlii.

If you are using a CryptR micro card in the camera's SD slot for FIPS level 3 encryption, you will not be able to use onboard storage in the SD card slot. For camera's with 2 microSD slots you can only use the slots for either storage or the CryptR micro card, both options cannot be used at the same time.

Cameras that include an onboard TPM do not support the CryptR micro card and can only use the SD slots for onboard storage.

NOTE

For cameras with 2 microSD card slots, the camera will record video to SD cards in both slots. The total storage capacity of the system is the combined storage capacity of each of the two individual cards.

Enabling Onboard Storage

To use the camera's onboard storage feature, you must first insert an SD card into the camera. Refer to the camera's installation manual for the location of the SD card slot.

TIP

The SD card will record from the camera's highest resolution, non-tiled stream. In most cases, this will be the primary stream.

NOTE

For cameras with 2 microSD card slots, the camera will record video to SD cards in both slots. The total storage capacity of the system is the combined storage capacity of each of the two individual cards.

1. On the Storage page, select the **Enable Onboard Storage** check box.
2. By default, the camera is set to only record to the SD card when it is unable to communicate with the network video management server. If you prefer to have the camera record video to both the network video management server and to the SD card, clear the **Record only when server connection is interrupted** check box to disable the setting.
3. Select one of the following recording modes:
   - **Continuous:** the camera never stops recording to the SD card.
   - **On Motion:** the camera only records when there is motion in the scene.
     If you are configuring an Avigilon video analytics camera, the On Motion setting will record either pixel change in the scene or analytics motion events depending on how the camera is configured in the Avigilon Control Center Client software.

   The recorded video will be divided into files no more than five minutes in length or 100 MB in size.
4. Select the **Enable Recordings Retention** checkbox to enable the camera to store recordings for a set amount of time, from a minimum of 5 minutes to a maximum of 2 years. You can assign the number of days, hours and minutes that the recordings will be stored.
5. On the Compression and Image Rate page, make sure the format is set to **H.264** or **H.265** to maximize the SD card recording capacity and performance.

Enable SD Card Encryption

You can enable SD card encryption to encrypt the video files as a security precaution.

IMPORTANT

Enabling or disabling encryption will format all inserted cards and erase all files on them.

1. Select the **Card Encryption** checkbox in the *Onboard Storage* area to enable card encryption.
2. Click the **Apply** button.

ONVIF Profile G

ONVIF Profile G allows video management systems to retrieve video from a camera's onboard storage when there is a gap in the VMS video due to a network outage or similar event.

- Cameras with firmware versions 4.4.0.X or later will have ONVIF Profile G already enabled.
- Cameras with firmware older than 4.4.0.X will have the option to **Enable ONVIF Profile G** when they upgrade their firmware.

  NOTE

  Enabling ONVIF Profile G will require reformatting the SD card. You will lose all footage currently recorded on the SD card. Ensure that you download any required video clips before enabling Profile G.

Onvif is a trademark of Onvif, Inc.

Downloading Recorded Video from the Web Interface

Listed in the Recordings section are all the videos that have been recorded to the SD card.

If you are using two SD cards you will have to select the SD card that you want to download video from. You may have to check both SD cards for the recording you want to download. The camera can record video to either SD card based on the remaining capacity of the SD cards.

If you are using a CryptR micro card in the camera's SD slot for FIPS level 3 encryption, you will not be able to use onboard storage in the SD card slot. For camera's with 2 microSD slots you can only use the slots for either storage or the CryptR micro card, both options cannot be used at the same time.

It is recommended that you download recorded video from the web interface. However, if your bandwidth is limited, you can choose to download the recorded video directly from the SD card. For more information, see *Downloading Recorded Video from the SD Card* on the next page.

To download recorded video from the web interface, perform the following:

TIP

If you are using two SD cards, select the SD card that you want to download the recording from.

1. On the Storage page, select the check box beside all the videos you want to download.
   To help you find the video you want, you can filter the videos by date and time. Select the **Filter** check box then select the time range.
2. Click **Download**.

The selected video files are automatically downloaded to your browser's default Downloads folder. If you are prompted by the browser, allow the download to occur.

> **NOTE**
> Do not close your browser window until the download is complete or the file may not download correctly. This is important if you are downloading multiple video files because the files are downloaded one by one.

Downloading Recorded Video from the SD Card

If you do not have enough bandwidth to download recorded video directly from the web interface, you can choose to download the recorded video directly from the SD card.

To download recorded video directly from the SD card, perform the following:

1. In the Settings area, disable onboard storage by clearing the **Enable Onboard Storage** check box then click **Apply**.
2. Remove the SD card from the camera.
3. Insert the SD card into a card reader.
4. When the Windows AutoPlay dialog box appears, select **Open folder to view files**.
5. Open the Avigilon Camera Footage application.
   The Avigilon Camera Footage window lists all the video files that are stored in the SD card.
   - To download all the recorded videos, click **Download All**.
   - To download specific video, select the video files you want then click **Download Selected**.
6. When you are prompted, choose a location to save the video files.
   The files start downloading from the SD card and are saved to the selected location.
7. When you are ready, eject the SD card.
8. Insert the SD card back into the camera then select Enable Onboard Storage to begin recording to the SD card again.

Deleting Recorded Video

As the SD card becomes full, the camera automatically starts overwriting the oldest recorded video. You can also choose to manually delete video to make room for new recordings.

On the Storage page, you can choose to delete video in the following ways:

- To delete individual video files, select all of the files you want to delete from the Recordings list then click **Delete**.
- To delete all of the recorded video files, click **Format Card** to format the SD card.

SD Card Failures

SD card failures can cause the camera to continuously reboot and compromise the camera's reliability. To prevent this, the SD card will be disabled if persistent failures are detected.

Once an SD card has been disabled, the camera and web interface will notify you of the issue:

- The camera's video will overlay warning text on the video image: `SD Card Recording Disabled! Replace card to re-enable.`

  > **NOTE**
  >
  > The video overlay message can be disabled on the camera's **Storage** page by clearing the **Enable video alert overlay on severe SD card failure** checkbox.

- The camera's Storage page will have a warning message when you select the page: `SD card slot was disabled due to card errors, please replace card.`

To re-enable the SD card, remove it from the SD card slot on the camera and replace it with a working SD card. A speed test will be run on the new card when it is inserted to determine if it will function without any issues.

You can also force the SD card to be re-enabled in the web interface by clicking **Force Re-Enabled SD Card Slot** on the **Storage** page.

> **IMPORTANT**
>
> Forcing the SD card to be re-enabled is not recommended unless you are sure there are no problems with the card. If the card continues to fail, it may cause the camera to enter a reboot loop and after continued persistent failures, the SD card will be disabled again.

Digital Inputs and Outputs

On the Digital Inputs and Outputs page, you can set up the external input and output devices that are connected to the camera. This option does not appear for cameras that do not support digital inputs and outputs.

1. To configure a digital input:
   a. In the Digital Inputs area, enter a name for the digital input in the **Name** field.
   b. Select the appropriate state from the **Circuit State** drop-down list. The options are:
      - **Normally Open**
      - **Normally Closed**

      > **NOTE**
      >
      > Some cameras can detect the circuit state of the digital inputs automatically and the input will trigger when a change in state is detected. For these cameras, the Circuit State setting will have no effect on the digital input function.

   c. The **Type** drop-down list is used for cameras that can have the day/night mode triggered by an external light detector. You will only see this option on cameras that support this feature. If the digital input will be used to control the day/night settings, select **Force IRCF** in the Type drop-down list. For day/night switching controlled by an external digital input, the **External** option must be selected as the **Day/Night Mode**. For more information on configuring the day/night mode, see *Image and Display* on page xx.

d. Click **Apply** to save your changes.
Once the digital input is connected to the camera, you will see the connection status in the **Circuit Current State** area. The status is typically *Open* or *Closed*.

2. To configure a digital output:
   a. In the Digital Outputs area, enter a name for the digital output in the **Name** field.
   b. Select the appropriate state from the **Circuit State** drop-down list.
   c. Check the **IRCF to Out** box to allow the camera's IR Cut Filter to control the external output.
   This feature is typically used when the camera is connected to an external IR illuminator. Once enabled, the IR illuminator is turned on when the camera's IR Cut Filter is in monochrome mode.
   d. In the **Duration** field, enter how long the digital output is active for when triggered. You can enter any number between 100 and 86,400,000 milliseconds.
   e. Click **Trigger** to manually trigger the digital output from the web interface.
   f. Click **Apply** to save your changes.

Washer

On the Washer page, you can activate the washer and wiper sequence to clean the window on H5A Explosion-Protected bullet cameras. The washer function is supported if these cameras have the optional washer installed. See the table below for the camera and washer models that support the washer function.

Camera Model	Camera Part Number	Washer Part Number
H5A Rugged PTZ	H5A-RGDPTZ-DP36	AVWASPT0V5L5M00 / AVWASPT0V23L11M00 / AVWASPT1V23L30M00 / AVWASPT3V23L30M00
H5A Explosion-Protected PTZ	H5EXPTZ-x0-BO30	AVGEX-WASEX2T4AT / AVGEX-WASEX2T4IN / AVGEX-WASEX2T4KC / AVGEX-WASEX2T4GOR
H5A Explosion-Protected Bullet camera	H5EX-xx-BO1	

To activate the washing sequence:

1. Click **Washer** on the left menu pane.
   Select the **Enable Washer** checkbox.
2. Set the **Wiper On Delay** to control the amount of time between the washer spray starting and the wiper function starting.
3. Set the time that the washer will spray in the **Washer Period** field.
4. Set the time that the wiper function will continue in the **Wiper Off Delay** field.
5. Click **Apply** to save your settings.

TIP

We recommend your washing sequence is set up so the Wiper On Delay is at least 4 seconds to give the washer time to spray the window. The Wiper Off Delay should be at least 8 seconds longer than the Washer Period to give the wiper time to clean the window after the spray has stopped.

Audio

Use the settings on the Audio page to adjust the audio quality of the camera.

For encoding the audio stream, you can choose from the Opus sound encoder, which produces high-quality sound, or the G.711 protocol sound encoder. Use the Opus encoder if you are using ACC software Release 6.10 or later (or a third-party video management system that supports the Opus protocol). Otherwise use the widely supported G.711 protocol.

1. In the Audio Settings section:
    a. In the **Encoding** field, specify the audio encoder to use:
        - **Opus**: Default high quality audio codec.
        - **G.711**: Supported on various platforms.
2. In the Device Speaker section, use the **Volume** slider to adjust the volume on the speaker (from 0 to 100).
3. In the Device Microphone section:
    a. Use the **Line in Gain** setting to adjust output of the microphone that is built into the camera.
4. Click **Apply** to save your changes.

Users

On the Users page, you can add new users, edit existing users, and change passwords.

Adding a User

1. On the Users page, click **Add...**.
2. On the Add User page, enter a User Name and Password for the new user.
3. In the **Security Group** drop-down list, select the access permissions available to this new user.
    - **Administrator**: full access to all the available features in the camera web interface.
    - **Operator**: has access to the Live View but limited access to the Setup features. The user can access the General page, Image and Display page, Compression and Image Rate page, Motion Detection page, Privacy Zones page, Digital Inputs and Outputs page, Microphone page and the Speakers page. The new user can also configure onboard storage settings but cannot delete video recordings or format the SD card.
    - **User**: has access to the Live View, but cannot access any of the Setup pages.
4. Click **Apply** to add the user.

Editing Users and Passwords

1. On the Users page, select a user from the User Name (Security Group) list and click **Modify**.
2. To change the user's password, enter a new password for the user.
3. To change the user's security group, select a different group from the **Security Group** drop-down list.

NOTE

You cannot change the security group for the administrator account.

4. Click **Apply** to save your changes.

Removing a User

NOTE

You cannot remove the default Administrator user unless there is another user with administrator privileges. The camera must always have at least one administrator user configured.

1. On the Users page, select a user from the User Name (Security Group) list.
2. Click **Remove**.

Keeping Usernames and Passwords After Firmware Revert

To add a layer of security to protect the camera from theft, you have the option of keeping the camera's current usernames and passwords after a firmware revert.

If you have set your camera to use FIPS 140-2 encryption, we recommend that you do not choose to keep usernames and passwords after a firmware revert. The password and username is not stored in a FIPS 140-2 compliant manner and may affect your FIPS 140-2 compliance.

Normally if you restore the camera firmware back to the factory default settings, the camera returns to using the default username and password. When you enable this feature, the camera will continue to use the configured username and passwords, so the camera cannot connect to new servers without the appropriate credentials.

IMPORTANT

Forgetting your own username or password after enabling this setting voids your warranty. The primary method of restoring the factory default username and password will be disabled.

1. At the bottom of the Users page, select the **Do not clear usernames or passwords on firmware revert** check box.
2. After you select the check box, the following popup message appears:

   Please store your administrator password in a safe place. Password recovery is not covered by warranty and loss of password voids your warranty.

3. Click **OK** if you agree to the feature limitations.

Always keep a copy of your password in a safe place to avoid losing access to your camera.

Camera Automation

You can create rules and assign actions to automate camera functions and responses on the *Automation* page.

Create and Manage Camera Rules

On the *Rules* tab, you can review the list of defined rules or create a new rule.

Follow these steps to create a new rule:

1. Click the **Add Rule** button.
2. Under *When the following trigger happens*, select the **Analytics** option if you want to create an Analytics rule and then select one of the following Analytics types:
    - Smart Motion Rule – when the camera detects a specific motion event, e.g., classified objects in the scene. You can select from the list of motion rules you created on the *Analytics* page. See *Create a Motion Analytic Event* on page xxxii for instructions.
    - Camera Tampering Rule – when the camera detects a person tampering with the camera itself.
    - Motion Detector – when the camera detects motion in the scene.
3. Alternatively, select the **SystemStatus** option if you want to create a system status rule and select the **SystemBooted** option. This rule triggers an action when the camera reboots.
4. You can click the **Simulate Trigger** button to test any rules that you have already defined using that trigger.
5. Under *And the following condition is true*, select an option:
    - Always – the rule will perform the action every time the selected trigger occurs.
    - Never – the rule will never perform the action, even if the selected trigger occurs. This can be used to temporarily disable a rule.
6. Under *Then perform this action*, select one of the following action types:
    - Email – sends an email when the selected trigger occurs and the condition is true.
    - Sequence – initiates a sequence of actions when the selected trigger occurs and the condition is true.
7. If you chose Email, select from the list of available email actions. If the email action you want isn't listed, you can create a new one by selecting **Add New** and filling out the form as described in the section titled *Create and Manage Sequences* under *Manage Sequences and Email Actions* below.
8. If you chose Sequence, select from the list of available sequence actions. If the sequence you want isn't listed, you can create a new one by selecting **Add New** and filling out the form as described in the section titled *Create and Manage Email Actions* under *Manage Sequences and Email Actions* below.
9. You can click the **Test Action** button to test the action.
10. Enter a Rule Name.
11. Click the **Save** button. The rule will be added to the *Defined Rules* list.
12. Click the ✎ icon to edit a rule.
13. Click the ⊗ icon to delete a rule.

Manage Sequences and Email Actions

On the *Actions* tab, you can create and configure the sequences or email actions that are used for the camera rules. This is helpful if you want to create reusable action types or edit the actions in one place.

IMPORTANT

Any changes you make to an action will affect all of the camera rules using it.

Create and Manage Sequences

You can click the **Sequence** button to review, edit, delete or add new sequences. The new sequence will appear on the *Sequence* list. You can use these sequences when creating rules.

Follow these steps to create a new sequence:

1. Click the **Add Sequence** button.
2. On the *Add Sequence* page, enter the following information:
    - Sequence Name – enter a descriptive name for the sequence action. This name is shown on the Add Rule page.
    - Wait before – enter the number of milliseconds you want the sequence to wait before performing the action.
    - Then perform this action – select an action type and choose the action rule. If you select Email as the action type, see Step 5 for instructions on how to add a new email action.
3. Click **Test** to test the sequence.
4. Click **Save**.

Create and Manage Email Actions

You can click the **Email** button to create, edit, delete or test email actions. You can also configure SMTP server information for the email actions.

IMPORTANT

Any changes you make to the SMTP server information will affect any rules that are already using that email.

Configure SMTP Server Information

If you are adding the SMTP server for the first time, the button is labeled **Configure SMTP** and the **Add Email** button is disabled and greyed out. See *Edit SMTP Server Information* on the next page for instructions on how to edit SMTP server information for existing SMTP configurations.

Follow these steps to configure SMTP Server information for the first time:

1. Click the **Configure SMTP** button.
2. Enter the following information:
    a. Enter the SMTP Server URL.
    b. Enter the Username on the server url you provided.
    c. Enter User password or app password for the username.
    d. Enter an email address for the sender's email.
3. Click **Save**.

Edit SMTP Server Information

Once an SMTP server has been configured, the **Configure SMTP** button changes to **Edit SMTP**, and the **Add Email** button becomes enabled.

Follow these steps to edit the SMTP Server information:

1. Click the **Edit SMTP** button.
2. Enter the following information:
    a. Enter the SMTP Server URL.
    b. Enter the Username on the server url you provided.
    c. Enter User password or app password for the username.
    d. Enter an email address for the sender's email.
3. Click **Save**.

Add Email

Follow these steps to create a new email action:

1. Click the **Add Email** button.
2. Enter a name for the Email Action.
3. Enter a recipient email address in the **Email To** field.
4. You can enter another email address in the **Email Cc** field, if required.
5. Enter the text that you want to use for the email's subject line in the **Email Subject** field.
6. Enter the text that you want the email to contain into the **Email Body** section.
7. Click **Save**.

System

On the System page, you can manually upgrade the camera firmware, reboot the camera, and restore all of the camera's factory default settings.

- To upgrade the camera firmware, see *Upgrading the Camera Firmware* on the next page.
- Click **Download** to Download Bug Report.
- Click **Reboot** to restart the camera.
- Click **Restore** to revert the camera firmware back to the factory default settings.
- Click **Soft Reset** to reset the camera to factory default settings, except for network settings.

TIP

If you've enabled the feature that maintains your username and password after a firmware revert, make sure you have a written copy of your current usernames and passwords. For more information, see *Keeping Usernames and Passwords After Firmware Revert* on page xlvi.

- (H4 Multisensor H4SL-DO and H4SL-BO cameras only) If the camera lens stops performing as expected and you are unable to focus the lens through the Image and Display page, you may need to reinitialize the lens.
  Click **Reinitialize** then wait as the lens reinitializes. A green message is displayed at the bottom of the page when the process is complete.

Upgrading the Camera Firmware

To manually upgrade the camera 's firmware:

1. Download the latest version of the firmware .bin file from the Avigilon website (avigilon.com/support) and complete the following steps:
2. On the System page, click Choose File to browse and locate the downloaded firmware file.
3. Click **Upgrade**. Wait until the camera upgrade is complete.

Licensing

> **NOTE**
> This feature is only available on H6A and H6X camera models at this time.

On the Licensing page, you can use a license activation key to enable certain features.

> **NOTE**
> For licensing support, visit https://www.avigilon.com/support.

1. Click **Add License...**
2. Enter a license activation key into the field.
3. Choose an activation method:
   - Automatic: use this option if the camera has Internet access.
   - Manual: use this option if the camera does not have Internet access.

Automatic Activation

Click **Activate Now** to activate your license.

Manual Activation

1. Click **Save File...** to generate an activation request file.
2. Upload the activation request file to our licensing website: https://licensing.avigilon.com/activate
   Your license file will be available for download.
3. Save the license file.
4. Click **Choose File...** and select the license file you saved in Step 3.

Device Log

The Device Log page allows you to view the camera's system logs and the camera access logs.

The most recent log event is always displayed first.

1. In the **Type** drop-down list, select one of the following:
   - **Access Logs** – Logs of users who have logged into the web interface.
   - **System Logs** – Logs of camera operations.
   - **Kernel Logs (debug)** – Logs of debug messages.
2. In the **Minimum Log Level** drop-down list, select the minimum level of log message you want to see:
   - **Error** – Sent when the camera encounters a serious error. These are the highest level log messages.
   - **Warning** – Sent when the camera encounters a minor error such as an invalid username and password.
   - **Info** – Status information sent by the camera. These are the lowest level log messages.
   - **Debug** – troubleshooting information sent by the camera to aid in diagnosing issues.
3. In the **Maximum Number of Logs** drop-down list, select the number of log messages you want displayed.
4. Click **Update**.
   The logs update to display the filtered information.

Disable WebUI

On the Disable WebUI page, you can disable the camera's web interface, including any non-ONVIF API calls. This will disable any access to the camera other than through the ACC Client or an ONVIF-compliant VMS.

IMPORTANT

If you disable the web UI and non-ONVIF APIs, you will only be able to connect to the camera with the ACC Client or an ONVIF-compliant VMS.
The only way to reverse this setting is by doing a physical firmware revert on the camera. See the camera's installation guide for more information.

To disable the web UI and non-ONVIF APIs:

1. Select the **Disable non-ONVIF APIs** checkbox.
2. Click **Apply**.
3. Read the warning message that appears, and click **OK** if you want to proceed with this setting.

About Page

On the About page, you can find information about your camera such as the firmware version, serial number, and ONVIF conformance.

Checking a Camera's Power Source

For camera's with multiple power source options, it may be useful to check the About page to confirm which power source is currently connected.

ACC™ ES Camera

If you are configuring an H4 Edge Solution (ES) camera, you will see the ACC ES application option in the left-menu pane.

H4 ES cameras feature a server component that runs the Avigilon Control Center Server software. This allows each H4 ES camera to also act as its own site and server.

From the ACC ES application pages, you can configure the streaming ports and archiving settings for the ACC Server software.

Checking the ACC ES Camera Status

On the first ACC ES application page, you can check the status of the Avigilon Control Center software.

- **Avigilon Control Center Information**
  - **ACC Site Name** – The name of the site that the camera is part of.
  - **ACC Server Name** – The name of the camera.
  - **ACC Server Status** – The status of the ACC Server software.
  - **ACC Server Version** – The version of the ACC Server software.

Configuring the ACC ES Camera Administration Settings

On the Setup page, you can configure the Avigilon Control Center system admin settings like you would in the ACC Admin Tool.

Restarting the ACC Software

If the ACC Server software is not operating as expected, you can try to resolve the issue by restarting the server component.

1. On the Setup page, click **Disable ACC ES**.
2. Click **Apply**.
   The camera shuts down the ACC Server software.
3. Click **Enable ACC ES** to restart the ACC Server software.

Formatting the Recorded Video Drive

ACC ES HD cameras include a solid state drive that stores recorded video directly on the camera. If you ever need to delete all configuration and recorded video data, you can reinitialize the storage.

1. To format the SSD, click **Reinitialize Storage**.
2. When the browser displays the following error message, click **OK**:
   This will require the ACC ES application to restart and will delete all ACC ES configuration settings and data. Are you sure you want to continue?

The ACC Server software on the camera restarts. The camera will continue to stream video but will not record anything until the ACC Server software has finished loading.

Changing the Communication Ports

ACC Server communicates with the ACC Client software through a range of UDP and TCP ports. The port ranges only need to be changed if the ACC Client software is trying to access two or more instances of the ACC Server that are behind the same NAT device (e.g. router), or if there is a port conflict.

1. In the Service Ports and RTP Ports area, you can change the Base Port that is used to access the ACC Server.
2. Click **Apply**.
3. When the browser displays the following error message, click **OK**:
   The new service base port or login limits will only take effect once Control Center Server is restarted. Restart Control Center Server now?

The ACC Server software on the camera restarts. The camera will continue to stream video but will not record anything until the ACC Server software has finished loading.

Overriding the Login Limit

By default, only 2 users can log in to the site at the same time. If you need extra access for users who will not be monitoring video, you can override the recommended login limit.

1. In the Login Limit area, select the **Override ACC Client Login Limit** check box.
2. In the **Login Limit:** field, enter how many users you would like to be able to login to the camera site at the same time.
3. Click **Apply**.

The new setting is saved. More than 2 users can now log in to the camera site.

NOTE

If more than 2 users log into the site simultaneously, be aware that this may cause degraded camera performance depending on the camera settings.

Enabling Storage Management

You must enable Storage Management before you can archive video in the ACC Client software. The Storage Management page allows you to enable the video archiving feature and set the network location where archived video is saved.

1. Select the **Enable Storage Management** check box.
2. From the **Network Protocol** drop-down list, select one of the following:
   - **CIFS** – Common internet file system. The network path is typically in this format: //*<hostname or IP>*/*<path>*
   - **NFS** – Network file system. The network path is typically in this format: *<hostname or IP>*:*<path>*
3. In the **Network Path** field, enter the path to the preferred video archiving location.
4. If the network location requires authentication, select the **Authentication** check box then enter the credentials in the Username and Password fields.
5. Click **Apply**.

Next, set up Schedule Archiving in the ACC Client software to allow the system to automatically archive recorded video to the selected network location. For more information, see the *Avigilon Control Center Client User Guide*.

Reviewing ACC Software Logs

The Logs page displays the site logs for Avigilon Control Center system events.

The most recent log event is always displayed first.

1. In the **Type** drop-down list, select one of the following:
   - **Daemon Logs** – Logs of ACC Server operations. This includes logging into the site, creating events, etc.
   - **App Logs** – Logs of the ACC ES application operations within the web interface.
2. Select one of the options from the **Minimum Log Level** drop-down list:
   - **Error** – Sent when the system encounters a serious error. These are the highest level log messages.
   - **Warning** – Sent when the system encounters a minor error such as an invalid username or password. This is selected by default.
   - **Info** – Status information sent by the system. These are the lowest level log messages.
3. In the **Maximum Number of Logs** drop-down list, select the number of log messages you want to display.
4. Click **Update**.
   The logs update to display the filtered information.
